

```

package it.polito.bigdata.spark.exercise30;

import org.apache.spark.api.java.*;
import org.apache.spark.SparkConf;

public class SparkDriver {

    public static void main(String[] args) {

        String inputPath;
        String outputPath;

        inputPath=args[0];
        outputPath=args[1];

        // Create a configuration object and set the name of the application
        SparkConf conf=new SparkConf().setAppName("Spark Exercise #30");

        // Create a Spark Context object
        JavaSparkContext sc = new JavaSparkContext(conf);

        // Read the content of the input file
        // Each element/string of the logRDD corresponds to one line of the
input file
        JavaRDD<String> logRDD = sc.textFile(inputPath);

        // Solution based on an named class
        // An object of the FilterGoogle is used to filter the content of the
RDD.
        // Only the elements of the RDD satisfying the filter imposed by means
        // of the call method of the FilterGoogle class are included in the
        // googleRDD RDD
        JavaRDD<String> googleRDD = logRDD.filter(new FilterGoogle());

        // Store the result in the output folder
        googleRDD.saveAsTextFile(outputPath);

        // Close the Spark context
        sc.close();

    }
}

```
