

## Data Management and Visualization

Politecnico di Torino

### NoSQL in MongoDB – Practice 6

## Part 1 - Compass

The practice purpose is to become familiar with MongoDB Compass tool. In this practice you are required to explore data and write some queries to retrieve data from a NoSQL database based on MongoDB.

## 1) Setup and remote database connection

### MongoDB Compass Install (Windows/Linux)

Download MongoDB Compass using one of the following links:

- Ubuntu (.deb): [https://downloads.mongodb.com/compass/mongodb-compass\\_1.18.0\\_amd64.deb](https://downloads.mongodb.com/compass/mongodb-compass_1.18.0_amd64.deb)
- RedHat (.rpm): [https://downloads.mongodb.com/compass/mongodb-compass-1.18.0.x86\\_64.rpm](https://downloads.mongodb.com/compass/mongodb-compass-1.18.0.x86_64.rpm)
- Windows (.exe) 64 bit:  
<https://downloads.mongodb.com/compass/mongodb-compass-1.18.0-win32-x64.exe>
- Mac OS (.dmg):  
<https://downloads.mongodb.com/compass/mongodb-compass-1.18.0-darwin-x64.dmg>

Install and open the application

### Connection Setup

1. Connect to the remote database using the following connection parameters:
  - a. **Hostname:** bigdatadb.polito.it
  - b. **Port:** 27017
  - c. **Authentication:** Username/Password
  - d. **Username:** Compass
  - e. **Password:** Compass19!
  - f. **Authentication database:** dbdmg
  - g. **SSL:** Unvalidated (insecure)
2. (Optional) Specify a **Favourite Name** to easily connect to the database in the future.
3. Click on **Connect**.
4. Access to **dbdmg**
5. Access to a specific partition (**Parkings/Bookings**).

## 2) Problem specifications

The database contains Car Sharing information divided into two main collections: Bookings and Parkings. The most relevant information for each collection is shown in Table 1 (Parkings) and 2 (Bookings).

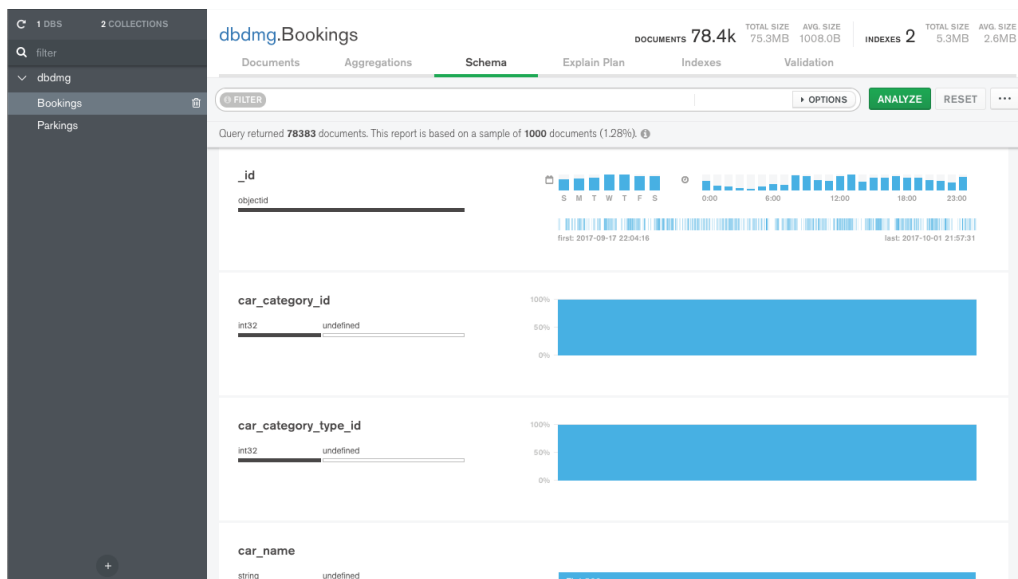

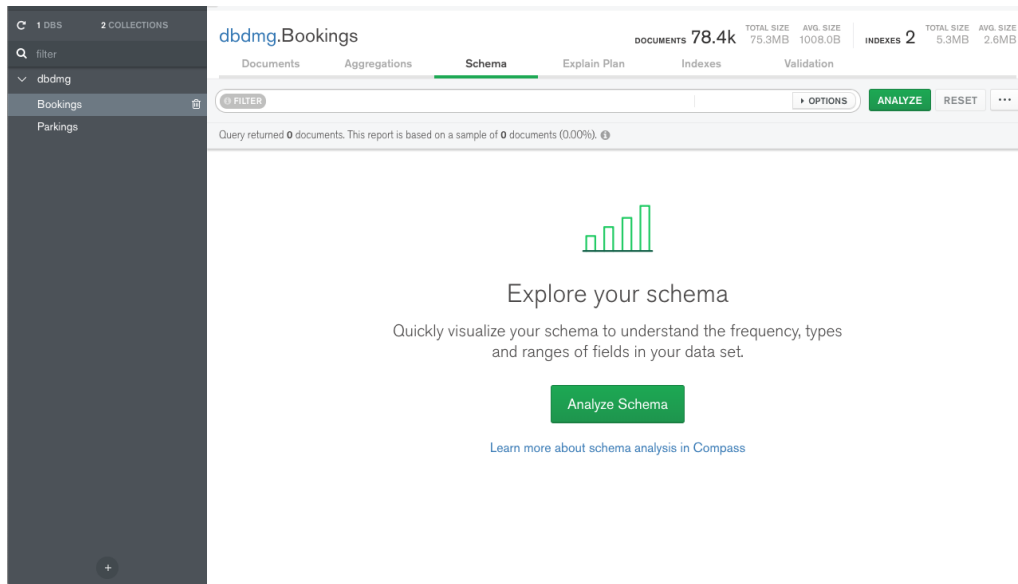

Name	Type	Description
<b>_id</b>	objectid	Document identifier.
<b>address</b>	string	Parking address of the vehicle.
<b>city</b>	string	City location of the vehicle.
<b>engineType</b>	string	Identifier of the engine type of the vehicle.
<b>exterior</b>	string	String describing the external condition of the vehicle during the parking.
<b>final_date</b>	date	Date and hour of the end of the parking period.
<b>fuel</b>	int32	Fuel level (0-100) during the parking period.
<b>init_date</b>	date	Date and hour of the beginning of the parking period.
<b>interior</b>	string	String describing the internal condition of the vehicle during the parking.
<b>loc</b>	coordinates	Coordinate of the parking location.
<b>plate</b>	int32	Identifier of the vehicle's plate.
<b>smartphoneRequired</b>	boolean	Boolean value denoting if the smartphone is required to start/finish the parking.
<b>vendor</b>	string	Company owner of the vehicle.
<b>vin</b>	string	Identifier of the chassis of the vehicle.

Table 1: **Parkings** database info.

Name	Type	Description		
<b>_id</b>	objectid	Document identifier.		
<b>car_name</b>	string	Vehicle's model		
<b>city</b>	string	City location where the vehicle has been booked.		
<b>distance</b>	int32	Distance covered during the vehicle renting.		
<b>driving</b>	Array	<b>distance</b>	int32	Distance covered during the vehicle renting (in meters).
		<b>duration</b>	int32	Duration of the renting (in seconds)
<b>engineType</b>	string	Identifier of the engine type of the vehicle.		
<b>exterior</b>	string	String describing the external condition of the vehicle during the renting.		
<b>final_address</b>	string	Address of the final position of the renting period.		
<b>final_date</b>	date	Date and hour of the end of the renting period.		
<b>final_fuel</b>	int32	Fuel level (0-100) at the end of the renting period.		
<b>init_address</b>	int32	Address of the starting position of the renting period.		
<b>init_date</b>	date	Date and hour of the beginning of the renting period.		
<b>init_fuel</b>	int32	Fuel level (0-100) at the beginning of the renting period.		
<b>interior</b>	string	String describing the internal condition of the vehicle during the renting.		
<b>plate</b>	int32	Identifier of the vehicle's plate.		
<b>smartphoneRequired</b>	boolean	Boolean value denoting if the smartphone is required to start/finish the parking.		
<b>vendor</b>	string	Company owner of the vehicle.		
<b>walking</b>	Array	<b>distance</b>	int32	Walk distance to reach the vehicle (in meters).
		<b>duration</b>	int32	Duration of the walking trip to reach the vehicle (in seconds).

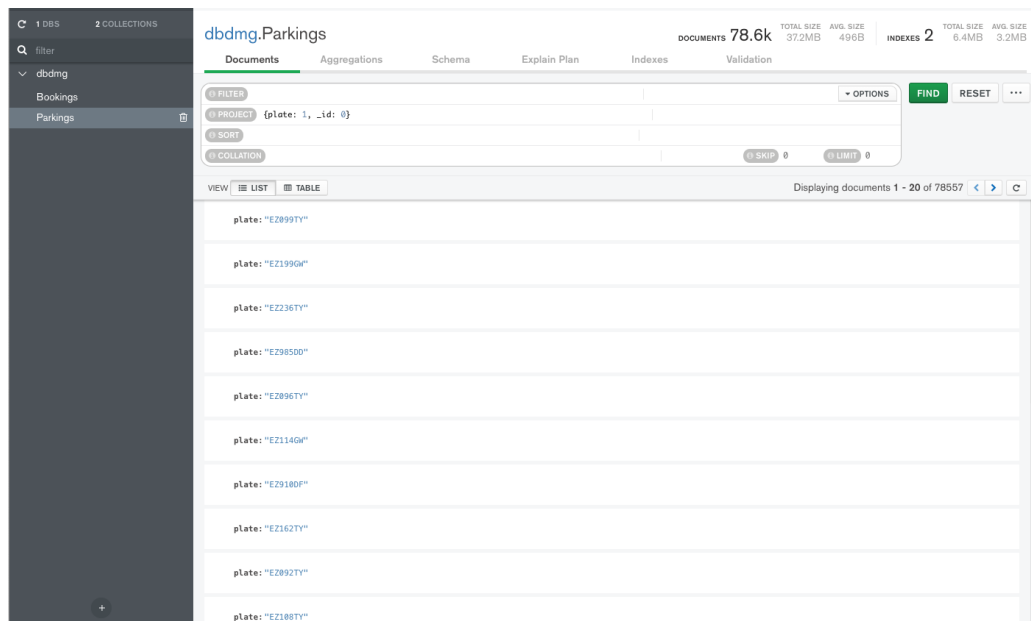

Table 2: **Bookings** database info.

### 3) Analyze the database using the Schema analyzer

1. ((Bookings) Identify the most common percentage(s) of fuel level at the beginning of the renting period.
2. (Bookings) Identify the most common percentage(s) of fuel level at the end of the renting period.
3. (Parkings) Identify the time range(s) with most parking requests (start parking).
4. (Parkings) Identify the time range(s) with most booking requests (end parking).
5. (Parkings) Visualize on the map the vehicles having the fuel level lower than 5%.

## 4) Querying the database

1. (Parkings) Find the plates and the parking addresses of the vehicles that begin the booking (end parking) after 2017-09-30 at 6AM.  
(Hint: it is possible to use the function `Date("<YYYY-mm-ddTHH:MM:ss>")` )
2. (Parkings) Find the addresses and the level of fuel of the vehicles that during the parking period had at least 70% of fuel level. Order the results according to descending value of fuel level.
3. (Parkings) Find the plate, the engine type and fuel level for 'car2go' vehicles (vendor) with good internal and external conditions.
4. (Bookings) For the renting that required a walking distance greater than 15 Km (to reach the vehicle), find the hour and the fuel level at the beginning of the renting period. Order results according to decreasing initial fuel level.

## 5) Data Aggregation

5. (Bookings) Group documents according to their fuel level at the end of the renting. For each group, select the average fuel level at the beginning of the renting period.
6. (Bookings) Select the average driving distance for each vendor. On average, for which vendor the users cover longer distances?

## Part 2 – MongoDB

The objective of the second part of the practice is to connect to a MongoDB instance, create and successfully populate a collection of documents. Then, visually explore the newly created collection and query the database exploiting different MongoDB functionalities and patterns. MongoDB is already installed at LABINF. To run the tutorial on your PC, you need to install **MongoDB Server** as indicated by the tutorial available on the course website.

### 1) Practise Setup

- a. Create a local folder (e.g.: C:\Users\<S123456>\Desktop\mongo\_database) and save its path, from now on called: my\_database\_path. This folder will contain the DB generate with MongoDB.
- b. Navigate to C:\Program Files\MongoDB\4.0\bin and open a command shell in the location (maiusc + right-click -> open command window here).  
( E.g. `cd C:\Program Files\MongoDB\4.0\bin`).
- c. Run the following command:  
`mongod --dbpath my_database_path`

### 2) Creating the database collection (Windows/Linux)

- a. Download the **Restaurants** database in json format from the course website  
E.g. "C:\Documents\lab\MongoDB\restaurants\_collection.json"
- b. Open another Command Shell in the folder of MongoDB (previous location)
- c. Run the following command:  
`mongoimport --db=restaurantsDB --collection=restaurants --file="C:\Documents\lab\MongoDB\restaurants_collection.json" --jsonArray`  
(Modify the json path based on your own configuration)

```
C:\Program Files\MongoDB\Server\4.2\bin>mongoimport --db=restaurantsDB --collection=restaurants --file="E:\DS-DBTech 2018-2019\lab\MongoDB\restaurants_collection.json" --jsonArray
2019-12-18T12:35:11.502+0100    connected to: mongod://localhost/
2019-12-18T12:35:11.563+0100    10 document(s) imported successfully. 0 document
(s) failed to import.
```

- d. Run the following command: `mongo`  
You are now logged into the Mongo Shell.
- e. Activate the restaurants db:  
`use restaurantsDB`

```
> use restaurantsDB
switched to db restaurantsDB
>
```

- f. In order to check the success of the import, run the command:  
`db.restaurants.find().pretty()`

```
> use restaurantsDB
switched to db restaurantsDB
> db.restaurants.find().pretty()
{
  "_id" : "002",
  "name" : "PandaParadise",
  "tag" : [
    "chinese",
    "japanese"
  ],
  "orderNeeded" : false,
  "maxPeople" : 50,
  "review" : 4.7,
  "cost" : "low",
  "location" : {
    "type" : "Point",
    "coordinates" : [
      45.0671,
      7.6627
    ]
  },
  "contact" : {
    "phone" : "+395487634998",
    "facebook" : "PandaP"
  }
}
{
  "_id" : "001",
```

### 3) Query on Restaurants database

Running queries of interest:

- Find all restaurants whose cost is medium
- Find all restaurants whose review is bigger than 4 and cost is medium or low
- Find all restaurants that can contain more than 5 people and:
  - whose tag contains "italian" or "japanese" and cost is medium or high  
OR
  - whose tag does not contain neither "italian" nor "japanese", and whose review is higher than 4.5
- Calculate the average review of all restaurants
- Count the number of restaurants whose review is higher than 4.5 and can contain more than 5 people
- Run query n. d) using the Map-Reduce paradigm
- Run query n. e) using the Map-Reduce paradigm
- Find the restaurant in the collection which is nearest to the point [45.0644, 7.6598]  
 Hint: remember to create the geospatial index.
- Find how many restaurants in the collection are within 500 meters from the point [45.0623, 7.6627]
