# Emergency management

FIRST RESPONDERS AND  
DECISION MAKERS

CITIZENS

Improving Resilience to Emergencies  
Through Advanced Cyber Technologies

# User engagement

2005

2022

# Who generates big data?

## □ User Generated Content (Web & Mobile)

□ E.g., Facebook, Instagram, Yelp, TripAdvisor, Twitter, YouTube

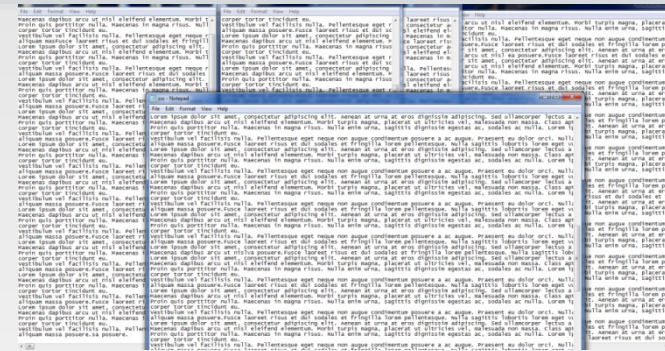

## □ Health and scientific computing

# Who generates big data?

- ❑ Log files
- ❑ Web server log files, machine syslog files
- ❑ Internet Of Things
- ❑ Sensor networks, RFID, smart meters

# What is big data?

## □ Many different definitions

*“Data whose scale, diversity and complexity require new architectures, techniques, algorithms and analytics to manage it and extract value and hidden knowledge from it”*

# What is big data?

## □ Many different definitions

*“Data whose **scale**, **diversity** and **complexity** require new architectures, techniques, algorithms and analytics to manage it and extract value and hidden knowledge from it”*

# What is big data?

## □ Many different definitions

*“Data whose scale, diversity and complexity require new **architectures**, **techniques**, **algorithms** and **analytics** to manage it and extract value and hidden knowledge from it”*

# What is big data?

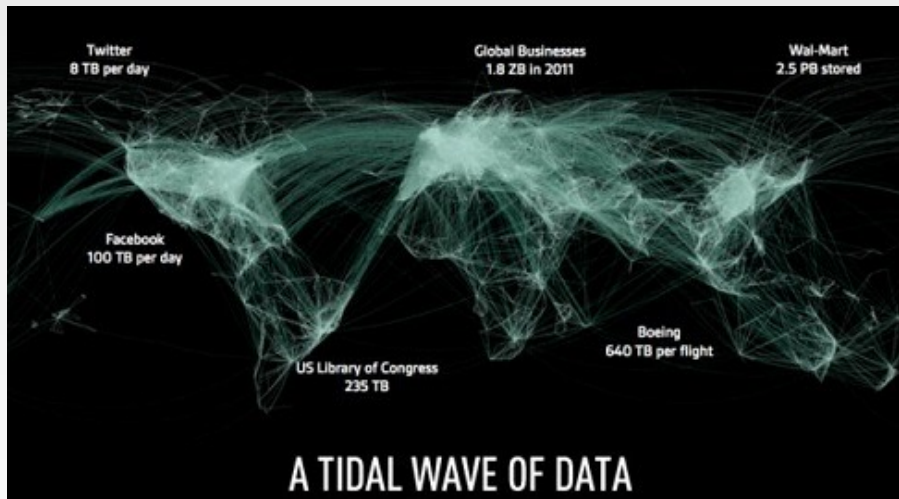

## □ Many different definitions

*“Data whose scale, diversity and complexity require new architectures, techniques, algorithms and analytics to manage it and extract **value** and hidden **knowledge** from it”*

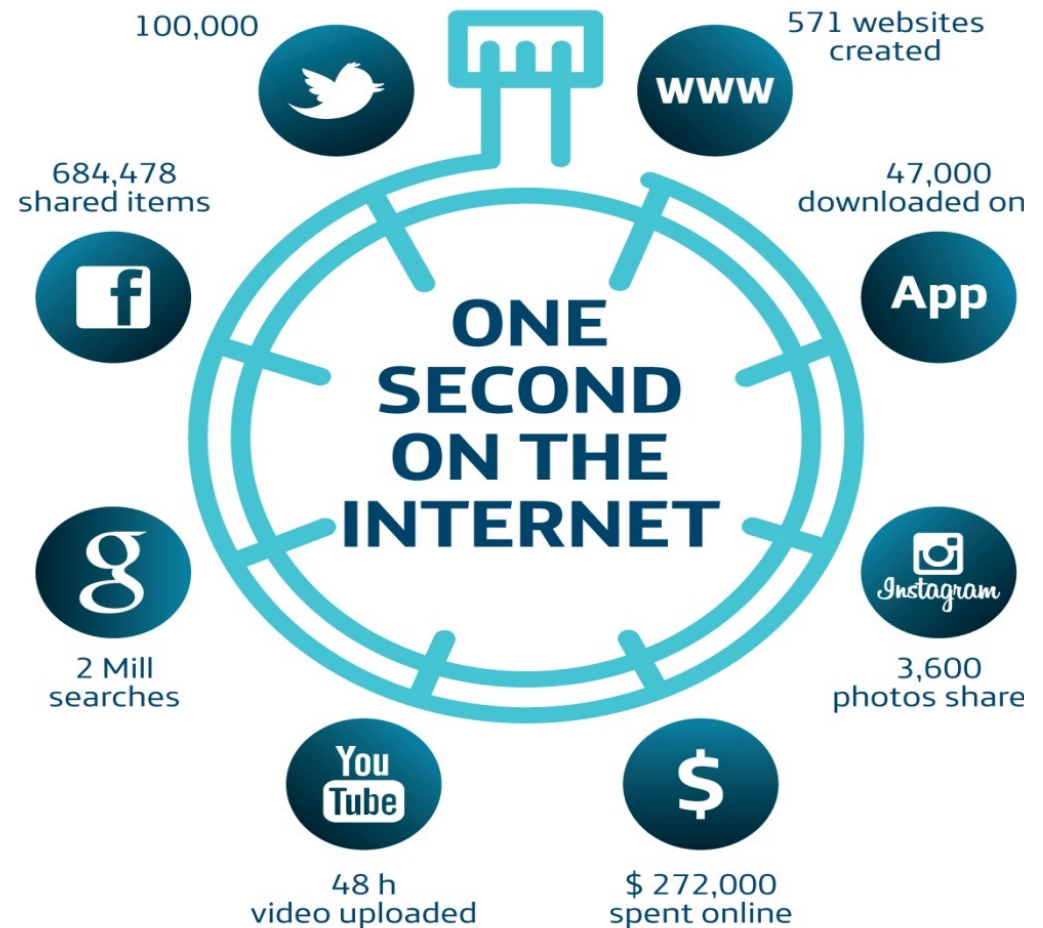

# The Vs of big data: Volume

- Data volume increases exponentially over time
- 44x increase from 2009 to 2020
- Digital data 35 ZB in 2020

# On the Internet...

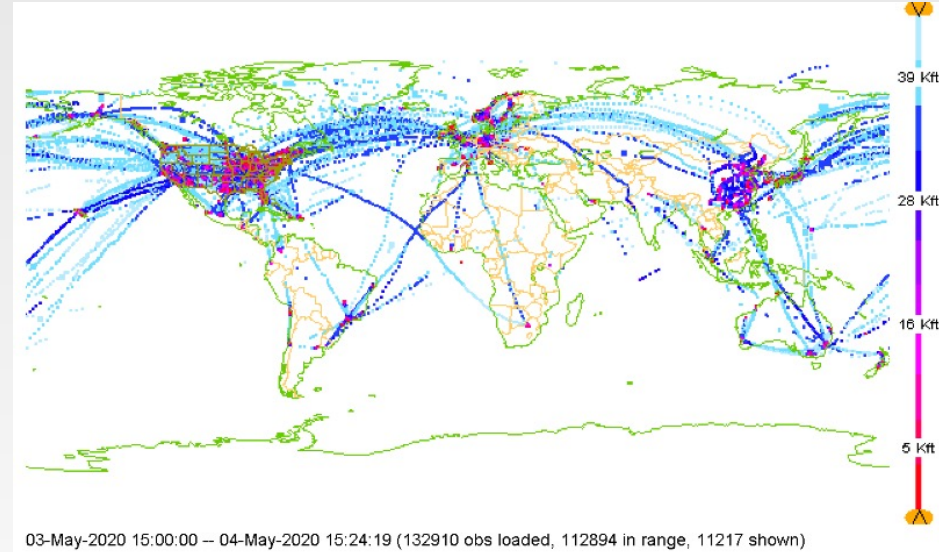

Source: Telefónica analysis based on Social and Digital Media Revolution Statistics 2013 from MistMediaGroup (<http://youtube.com/watch?v=Slb5x5fixk4>).

# Weather forecast

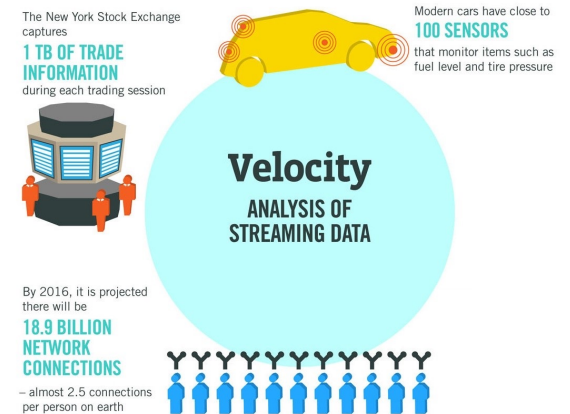

January 2020

May 2020

# The Vs of big data: Velocity

- ❑ Fast data generation rate
  - ❑ Streaming data
- ❑ Very fast data processing to ensure timeliness

# (Near) Real time processing

Crowdsourcing

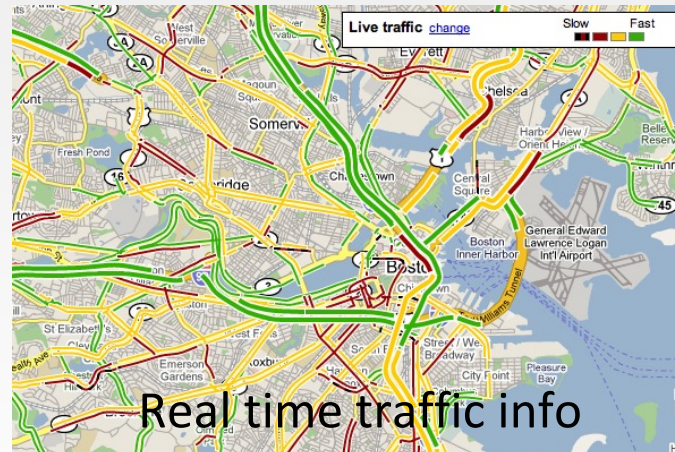

Computing

Map data

Sensing

Real time traffic info

# The Vs of big data: Variety

- ❑ Various formats, types and structures
  - ❑ Numerical data, image data, audio, video, text, time series

- ❑ A single application may generate many different formats

# The Vs of big data: **Veracity**

□ Data quality

# The most important V: Value

□ Translate data into business advantage

# Big data challenges

- ❑ Technology & infrastructure
  - ❑ New architectures, programming paradigms and techniques

*Transfer the processing power to the data*
  - ❑ Apache Hadoop/Spark ecosystem
- ❑ Data management & analysis
  - ❑ New emphasis on “data”

➔ ***Data science***

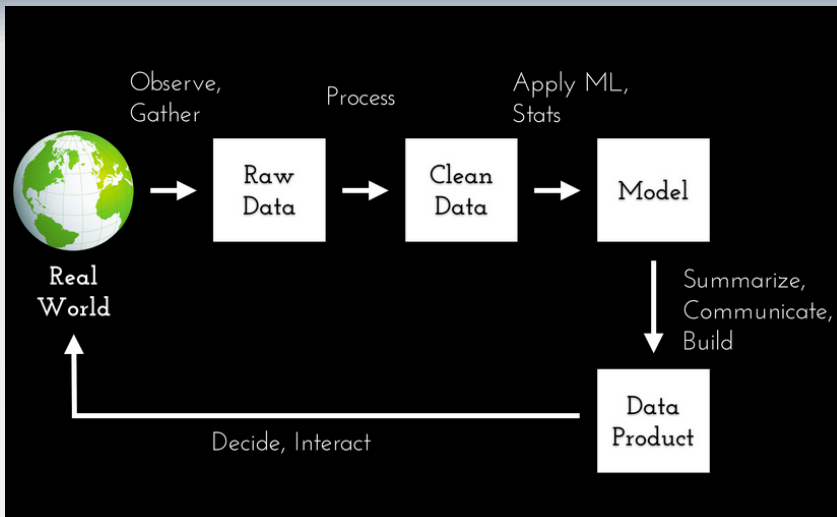

# Data science

“Extracting meaning from very large quantities of data”

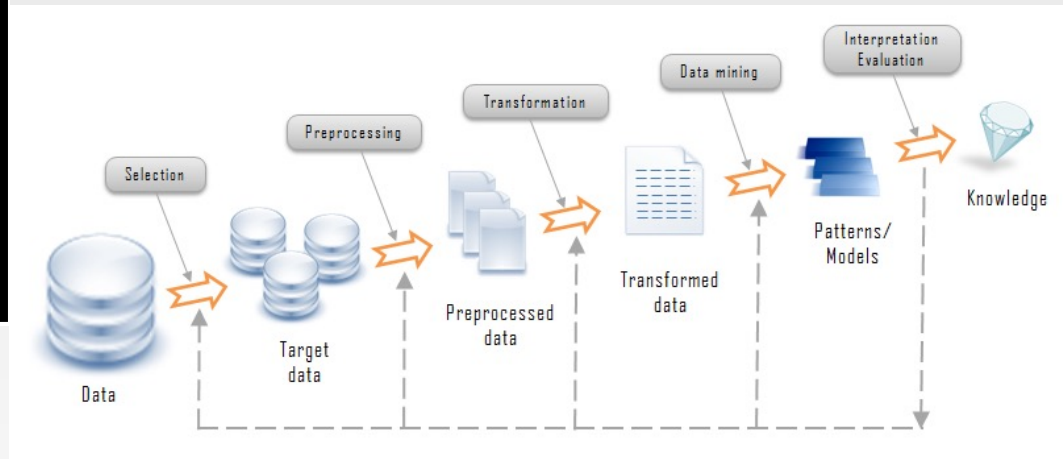

D.J. Patil coined the word *data scientist*

# The data science process

AKA *KDD* process

Knowledge Discovery in Databases

Generation

Acquisition

Storage

Analysis

# Generation

- ❑ Passive recording
  - ❑ Typically structured data
  - ❑ Bank trading transactions, work hours, government sector archives
- ❑ Active generation
  - ❑ Semistructured or unstructured data
  - ❑ User-generated content, e.g., social networks
- ❑ Automatic production
  - ❑ Location-aware, context-dependent, highly mobile data
  - ❑ Sensor-based Internet-enabled devices (IoT)

# Acquisition

## ☐ Collection

- ☐ Pull-based, e.g., web crawler
- ☐ Push-based, e.g., video surveillance, click stream

## ☐ Transmission

- ☐ Transfer to data center over high capacity links

## ☐ Preprocessing

- ☐ Integration, cleaning, redundancy elimination

# Storage

- ❑ Storage infrastructure
  - ❑ Storage technology, e.g., HDD, SSD
  - ❑ Networking architecture, e.g., DAS, NAS, SAN
- ❑ Data management
  - ❑ File systems (HDFS), key-value stores (Memcached), column-oriented databases (Cassandra), document databases (MongoDB)
- ❑ Programming models
  - ❑ Map reduce, stream processing, graph processing

# Analysis

## ❑ Objectives

- ❑ Descriptive analytics, predictive analytics, prescriptive analytics

## ❑ Methods

- ❑ Statistical analysis, machine learning and data mining, text mining, network and graph data mining
- ❑ Association analysis, classification and regression, clustering
- ❑ Diverse domains call for customized techniques

# Data mining

- ❑ Non trivial extraction of

- ❑ implicit
  - ❑ previously unknown
  - ❑ potentially useful

information from available data

- ❑ Extraction is automatic

- ❑ performed by appropriate algorithms

- ❑ Extracted information is represented by means of abstract models

- ❑ denoted as *pattern*

# Profiling: examples of data

- ❑ Consumer behavior in e-commerce sites

- ❑ Selected products, requested information, ...

- ❑ Search engines and portals

- ❑ Query keywords, searched topics and objects

- ❑ Social network data

- ❑ Profiles (Facebook, Instagram, ...)

- ❑ Dynamic data: posts on blogs, FB, tweets

- ❑ Maps and georeferenced data

- ❑ Localization, interesting locations for users

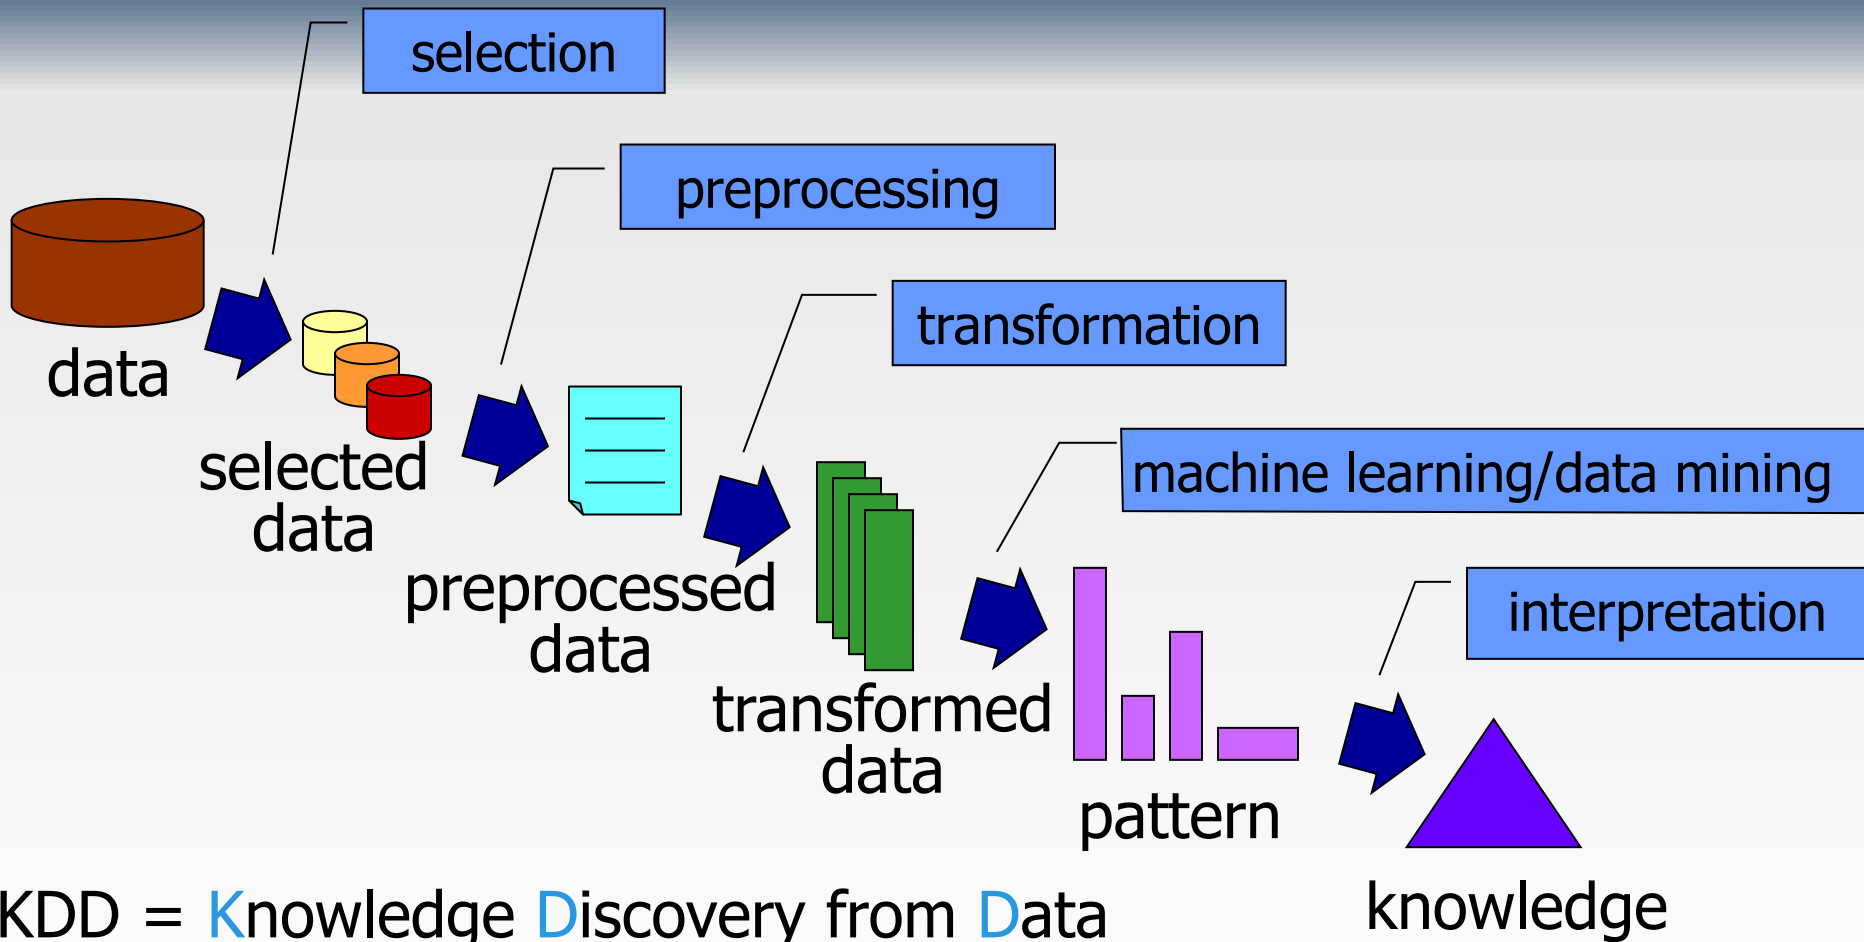

# Profiling: examples of applications

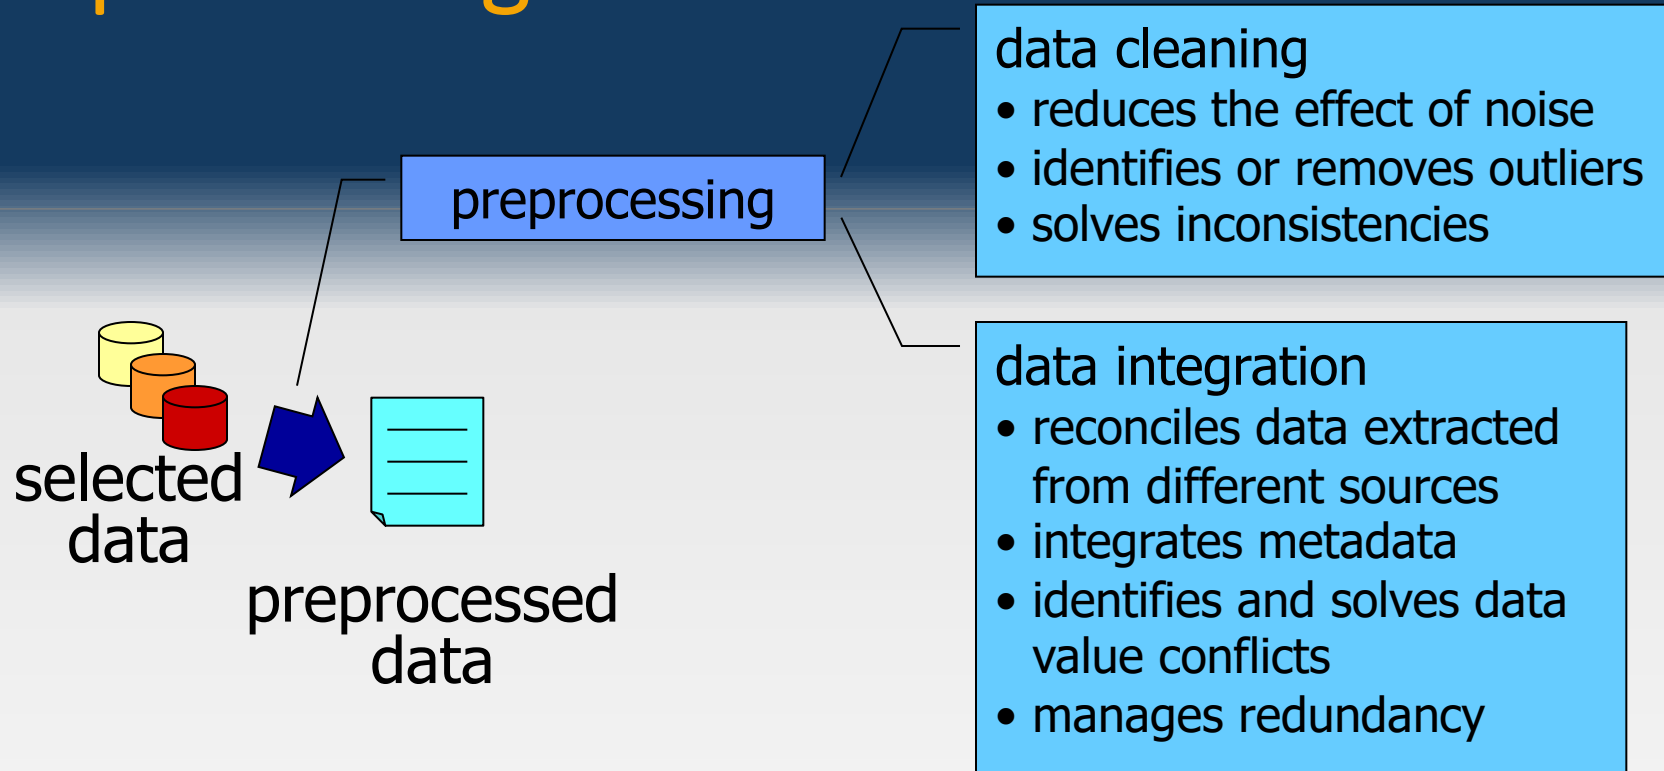

- ❑ User/service profiling
  - ❑ Recommendation systems, advertisements
- ❑ Market basket analysis
  - ❑ Correlated objects for cross selling
  - ❑ User registration, fidelity cards
- ❑ Context-aware data analysis
  - ❑ Integration of different dimensions
  - ❑ E.g., location, time of the day, user interest
- ❑ Text mining
  - ❑ Brand reputation, sentiment analysis, topic trends

# Knowledge Discovery Process

KDD = Knowledge Discovery from Data

# Preprocessing

Real world data is "dirty"  
Without good quality data, no good quality pattern

# A word from practitioners

- ❑ At least 80-90% of their work involves not machine learning, but
  - ❑ Working with experts to understand the domain, assumptions, questions
  - ❑ Trying to catalog and make sense of the data sources
  - ❑ Wrangling, extracting, and integrating the data
  - ❑ Cleaning the wrangled data

# Association rules

## ❑ Objective

- ❑ extraction of frequent correlations or pattern from a transactional database

Tickets at a supermarket counter

TID	Items
1	Bread, Coke, Milk
2	Beer, Bread
3	Beer, Coke, Diapers, Milk
4	Beer, Bread, Diapers, Milk
5	Coke, Diapers, Milk
...	...

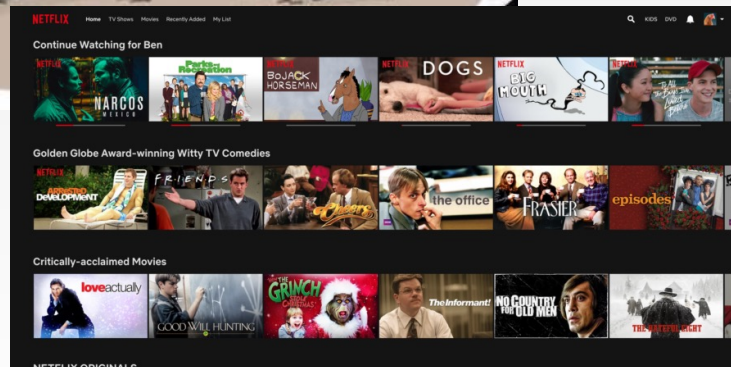

## ■ Association rule

diapers  $\Rightarrow$  beer

- 2% of transactions contains both items
- 30% of transactions containing diapers also contain beer

# Association rules

## Frequently Bought Together

Price For All Three: £9.00

Add all three to Basket

# Clustering

## Objectives

- detecting groups of similar data objects
- identifying exceptions and outliers

# Classification

## Objectives

- prediction of a class label
- definition of an data-driven model (descriptive profile) of a given phenomenon, which will allow the assignment of unlabeled data objects to the appropriate class

# Classification

- Training set
  - Collection of labeled data objects used to learn the classification model

# Classification

## □ Test set

- Collection of labeled data objects used to validate the classification model

## □ New data with unknown class label

- The data-driven model is exploited to predict the class label

# Classification techniques

## A plethora of different algorithms

- ☐ Decision trees
- ☐ Classification rules
- ☐ Association rules
- ☐ Neural Networks
- ☐ Naïve Bayes and Bayesian Networks
- ☐ k-Nearest Neighbours (k-NN)
- ☐ Support Vector Machines (SVM)
- ☐ ...

## Evaluation dimensions

- ☐ **Accuracy**
  - ☐ quality of the prediction
- ☐ **Interpretability**
  - ☐ model interpretability
  - ☐ model compactness
- ☐ **Robustness**
  - ☐ noise, missing data
- ☐ **Incrementality**
  - ☐ model update in presence of newly labelled record
- ☐ **Efficiency**
  - ☐ model building time
  - ☐ classification time
- ☐ **Scalability**
  - ☐ training set size
  - ☐ attribute number

# Artificial Neural Networks

- ▣ Inspired to the structure of the human brain
  - ▣ Neurons as elaboration units
  - ▣ Synapses as connection network

Biological Neuron

# Artificial Neural Networks

## □ Different tasks, different architectures

image understanding: convolutional NN (CNN)

time series analysis: recurrent NN (RNN)

numerical vectors classification: feed forward NN (FFNN)

denoising: auto-encoders

# Classification

Person  
Car  
Motorcycle  
Helmet

# Other techniques

## ❑ Sequence mining

- ❑ ordering criteria on analyzed data are taken into account
- ❑ example: motif detection in proteins

## ❑ Time series and geospatial data

- ❑ temporal and spatial information are considered
- ❑ example: sensor network data

## ❑ Regression

- ❑ prediction of a continuous value
- ❑ example: prediction of stock quotes

## ❑ Outlier detection

- ❑ example: intrusion detection in network traffic analysis

# The data science process

What *question* are you answering?

What is the right *scope* of the project?

What *data* will you use?

What *techniques* are you going to try?

How will you *evaluate* your result?

What *maintenance* will be required?

# The data science recipe

- ❑ Different ingredients needed
  - ❑ Data expert
    - ❑ Data processing, data structures
  - ❑ Data analyst
    - ❑ Data mining, statistics, machine learning
- ❑ Visualization expert
  - ❑ Visual art design, storytelling skills
- ❑ Domain expert
  - ❑ Provide understanding of the application domain
- ❑ Business expert
  - ❑ Data driven decisions, new business models

# Open issues

- ❑ Social impact of analysis is very important
  - ❑ Interpretability and transparency of the analysis process
  - ❑ Bias in algorithms and data
  - ❑ Privacy preservation
- ❑ AI-based systems are often «black boxes»
  - ❑ It is unclear for humans why an AI system makes a certain decision based on some input data
  - ❑ Because of the opaqueness people cannot assess whether they were discriminated against on the basis of, e.g., racial origin

# Interpretability in machine learning

*“The ability to explain or to present in understandable terms to a human”*

Open the black box

Trade-off Accuracy-Interpretability

- ❑ **Model explanation:** global understanding of how a model works
- ❑ **Prediction explanation:** local understanding of why a prediction is made
- ❑ **Interpretable feature selection:** incorporating interpretability-based criteria into the model design

# Interpretability

- ❑ Learned decision rule in pneumonia patients dataset from USA hospital

*history of asthma → lower chance of dying from pneumonia*

- ❑ MD consider asthma as a serious risk factor for people who get pneumonia

- ❑ Analysis

- ❑ asthmatics probably notice earlier the symptoms of pneumonia
- ❑ a healthcare professional is going to provide earlier pneumonia diagnosis
- ❑ as high-risk patients, they're going to get high-quality treatment sooner than other people

➡ asthmatics actually have almost half the chance of dying of non-asthmatics

- ❑ Using a neural network, this model issue would *never* have been uncovered

# Algorithmic and data bias

- ❑ Task: predict likelihood of an individual committing a future crime
  - ❑ Risk scores used by US criminal justice system
- ❑ Scores computed from
  - ❑ Questions answered by the defendants
  - ❑ Information pulled by criminal records
- ❑ Race was not among the questions
  - ❑ ... however other items may be correlated (e.g., poverty, joblessness)
- ❑ Software product flagged black defendants as future criminals more frequently than white defendants
  - ➡ Training data was biased by a larger black defendant population

# CV-scanning tool

- ❑ In 2014, Amazon's data scientists simplified **employee recruitment**
  - ❑ an AI algorithm to automatically identify the most qualified candidates from a vast pool of resumes.
- ❑ Issue: the algorithm discriminated against women.
  - ❑ The data-driven model was derived from analysis of resumes submitted in the past, which were dominated by male applicants
  - ❑ The algorithm learned that men would be better applicants than women

# Privacy

Strava released their global heatmap.  
13 trillion GPS points from their users

The screenshot shows the Strava Labs website. At the top, there's a navigation bar with 'STRAVA LABS' and links to 'Projects', 'Blog', 'Developers', 'Strava.com', and 'Careers'. Below this is a 'Global Heatmap' section with a 'Heatmap Color' dropdown and a zoom control. The main content area features a Guardian article titled 'Fitness tracking app Strava gives away location of secret US army bases'. The article includes a sub-headline 'Data about exercise routes shared online by soldiers can be used to pinpoint overseas facilities' and a link to 'Latest: Strava suggests military users 'opt out' of heatmap as row deepens'. The article is categorized under 'Opinion', 'Sport', 'Culture', 'Lifestyle', and 'More'. The background of the article shows a heatmap of a region, with labels for 'IRAQ' and 'AFGHANISTAN'.

The screenshot shows a BBC News article titled 'Fitness app Strava lights up staff at military bases'. The article is dated '29 January 2018' and includes social media sharing options. The main image is a heatmap showing the movements of soldiers within Bagram air base in Afghanistan. The article text states: 'Security concerns have been raised after a fitness tracking firm showed the exercise routes of military personnel in bases around the world.'

# How AI can lead to discrimination

## Definition of the label to be predicted

- Objective: Selection of the best employees of a company
- Method: What criteria are used to define a good employee?
- Issue: It is easy to discriminate against protected categories (even if this is done unintentionally)

## The data used to train the model contains biases

- The data model created by an AI algorithm reflects the biases in the data
- Examples: Datasets with only male resumes, datasets with only crimes committed by foreign nationals

## Attributes used to create the data-driven model

- Objective: Automatic selection of the best resumes for specific leadership positions
- Interesting attributes: University Name, Disciplines, Graduation grade
- Issue: The company could consider individuals who have studied at famous and prestigious (expensive) universities  
This would discriminate against individuals with strong backgrounds who have not studied at famous universities.

## Proxies

- Variables that are 'neutral' and not directly discriminatory (e.g., zip code)
- These variables may be indirectly correlated with a minority category (e.g., zip code only for certain geographic areas)

# Responsible Artificial Intelligence

- ❑ Ethical principles
  - ❑ Mandatory for fully-integrating AI systems in our society
  - ❑ Enforced throughout the
    - ❑ development
    - ❑ implementation
    - ❑ operation stages
  - ❑ of new AI solutions
- ❑ **Companies need to adopt clear processes and practices that ensure AI systems comply with strict responsible AI principles**

# Responsible AI

## □ Fairness

- AI systems must be designed in ways that **maximize fairness, non-discrimination and accessibility.**
- All AI designs should promote inclusivity by correcting both unwanted data biases and unwanted algorithmic biases.

## □ Reliability, Safety, and Security

- AI systems should cause no direct harm and always aim to **minimize indirect harmful behavior.**
- AI systems must be reliable in that they should always perform as from unauthorized parties.

## □ Privacy

- By design, AI systems must respect privacy by providing individuals with agency over their data and the decisions made with it.
- AI systems must also respect the integrity of the data they use.

# Responsible AI

## □ Transparency

- AI-based systems must be **explainable and understandable**.
- AI systems should produce outputs that are easily comprehensible to the stakeholder

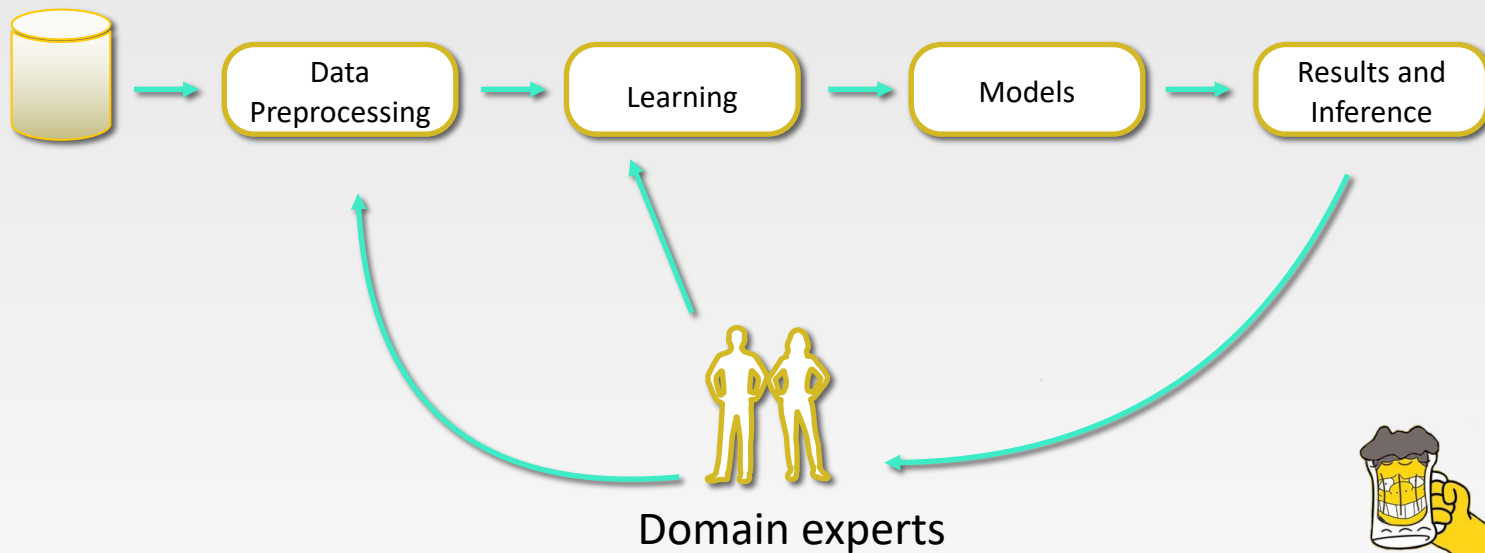

## □ Sustainability

- AI-based systems should attempt to be **societally sustainable** by empowering society and democracy
- **environmentally sustainable**, by reducing the amount of power required to train and run these systems.

## □ Accountability

- AI systems should be developed and deployed through consultation and collaboration with all stakeholders such that true accountability becomes possible.
- The long-term effects of any AI application should be understandable by all stakeholders
- If an AI system deviates from its intended results, then we need to have policies in place to ensure those deviations are detected, reported and remedied.

# Humans in the loop (HITL)

TO HUMANS:  
THE CAUSE OF-AND SOLUTION  
TO- ALL BIASES

# Open issues

- ❑ Social impact of analysis is very important
  - ❑ Towards responsible AI systems
- ❑ Many technical issues are not solved
  - ❑ Data dimensionality
  - ❑ Complex data structures, heterogeneous data formats
  - ❑ Data quality
