Relational Algebra Operations and MapReduce

Relational Algebra Operators

- The relational algebra and the SQL language have many useful operators
 - Selection
 - Projection
 - Union, intersection, and difference
 - Join (see Join design patterns)
 - Aggregations and Group by (see the Summarization design patterns)

Relational Algebra Operators

- The MapReduce paradigm can be used to implement relational operators
 - However, the MapReduce implementation is efficient only when a full scan of the input table(s) is needed
 - i.e., when queries are not selective and process all data
 - Selective queries, which return few tuples/records of the input tables, are usually not efficient when implemented by using a MapReduce approach

Relational Algebra Operators

- Most preprocessing activities involve relational operators
 - E.g., the ETL processes in the data warehousing application context
 - E.g., the computation of the friends of a user

5

6

Relations/Tables

- Relations/Tables (also the big ones) can be stored in the HDFS distributed file system
 - They are broken in blocks and spread across the servers of the Hadoop cluster

Relations/Tables

- Note
 - In relational algebra, relations/tables do not contain duplicate records by definition
 - This constraint must be satisfied by both the input and the output relations/tables

Selection

- σ_c (R)
 - Apply predicate (condition) C to each record of table R
 - Produce a relation containing only the records that satisfy predicate C
- The selection operator can be implemented by using the filtering pattern

Selection

Courses	CCode	CName	Semester	ProfID
	M2170	Computer science	1	D102
	M4880	Digital systems	2	D104
	F1401	Electronics	1	D104
	F0410	Databases	2	D102

- Find the courses held in the second semester
- σ_{Semester=2} (Courses)

9

Result	CCode	CName	Semester	ProfID
	M4880	Sistemi digitali	2	D104
	F0410	Basi di dati	2	D102

Selection

- Map-only job
- Mappers
 - Analyze one record at a time of its split
 - If the record satisfies C then emit a (key,value) pair with key=record and value=null
 - Otherwise discard the record

Projection

- π_s(R)
 - For each record of table R, keep only the attributes in S
 - Produce a relation with a schema equal to S (i.e., a relation containing only the attributes in S)
 - Remove duplicates, if any

Projection

Professors	ProfId	PSurname	Department
	D102	Smith	Computer engineering
	D105	Jones	Computer engineering
	D104	Smith	Electronics

- Find the surnames of all professors
- π_{PSurname}(Professors)

Projection

Duplicated values are removed

Union

• $\mathsf{R} \cup \mathsf{S}$

- R and S have the same schema
- Produce a relation with the same schema of R and S
- There is a record t in the output of the union operator for each record t appearing in R or S
- Duplicated records are removed

Union

17

Union

- Mappers
 - For each input record t in R, emit one (key, value) pair with key=t and value=null
 - For each input record t in S, emit one (key, value) pair with key=t and value=null
- Reducers
 - Emit one (key, value) pair for each input (key, [list of values]) pair with key=t and value=null
 - i.e., one single copy of each input record is emitted

Intersection

${}^{\bullet} \mathsf{R} \cap \mathsf{S}$

- R and S have the same schema
- Produce a relation with the same schema of R and S
- There is a record t in the output of the intersection operator if and only if t appears in both relations (R and S)

19

Intersection

DegreeCourseProf

21

22

Intersection

- Mappers
 - For each input record t in R, emit one (key, value) pair with key=t and value=t
 - For each input record t in S, emit one (key, value) pair with key=t and value=t

Intersection

Reducers

- Emit one (key, value) pair with key=t and value=null for each input (key, [list of values]) pair with [list of values] containing two values
 - It happens if and only if both R and S contain t

23

Difference

R - S

- R and S have the same schema
- Produce a relation with the same schema of R and S
- There is a record t in the output of the difference operator if and only if t appears in R but not in S

Difference

DegreeCourseProf

Result

ProfID	PSurna me	Department
D105	Jones	Computer engineering
D104	White	Electronics

Difference

- Mappers
 - For each input record t in R, emit one (key, value) pair with key=t and value=name of the relation (i.e., R)
 - For each input record t in R, emit one (key, value) pair with key=t and value=name of the relation (i.e., S)
- Two mapper classes are needed
 - One for each relation

Difference

- Reducers
 - Emit one (key, value) pair with key=t and value=null for each input (key, [list of values]) pair with [list of values] containing only the value R
 - It happens if and only if t appears in R but not in S

Join

- The join operators can be implemented by using the Join pattern
 - By using the reduce side or the map side pattern depending on the size of the input relations/tables

Aggregations and Group by

 Aggregations and Group by are implemented by using the Summarization pattern
