

Big data: architectures and data analytics

Spark MLlib

Textual data classification

Textual data classification

- The following slides show how to
 - Create a classification model based on the logistic regression algorithm for **textual documents**
 - Apply the model to new textual documents
- The input training dataset represents a textual document collection
 - Each line contains one document and its class
 - The class label
 - A list of words (the text of the document)

Textual data classification

- Consider the following example file
 - 1,The Spark system is based on scala
 - 1,Spark is a new distributed system
 - o,Turin is a beautiful city
 - o,Turin is in the north of Italy
- It contains four textual documents
- Each line contains two attributes
 - The class label (first attribute)
 - The text of the document (second attribute)

5

Textual data classification

- DataFrame associated with the input data before pre-processing

Label	Text
1	The Spark system is based on scala
1	Spark is a new distributed system
o	Turin is a beautiful city
o	Turin is in the north of Italy

6

Textual data classification

- A set of preprocessing steps must be applied on the textual attribute before generating a classification model

7

Textual data classification

1. Since Spark ML algorithms work only on “Table”, the textual part of the input data must be translated in a set of attributes in order to represent the data as a table
 - Usually a table with an attribute for each word is generated

8

Textual data classification

2. Many words are useless (e.g., conjunctions)
 - Stopwords are usually removed

9

Textual data classification

- The words appearing in almost all documents are not characterizing the data
 - Hence, they are not very important for the classification problem
- The words appearing in few documents allow distinguish the content of those documents (and hence the class label) with respect to the others
 - Hence, they are very important for the classification problem

10

Textual data classification

3. Traditionally a weight, based on the TF-IDF measure, is used to assign a difference importance to the words based on their frequency in the collection

11

Textual data classification

- DataFrame associated with the input data after the transformations (tokenization, stopword removal, TF-IDF computation)

Label	Spark	system	scala
1	0.5	0.3	0.75	..
1	0.5	0.3	0	...
0	0	0	0	...
0	0	0	0	...

12

Textual data classification: example

```
package it.polito.bigdata.spark.sparkmllib;

import org.apache.spark.api.java.*;
import org.apache.spark.sql.DataFrame;
import org.apache.spark.sql.Row;
import org.apache.spark.sql.SQLContext;
import org.apache.spark.ml.Pipeline;
import org.apache.spark.ml.PipelineModel;
import org.apache.spark.ml.PipelineStage;
import org.apache.spark.ml.classification.LogisticRegression;
import org.apache.spark.ml.feature.Tokenizer;
import org.apache.spark.ml.feature.HashingTF;
import org.apache.spark.ml.feature.IDF;
import org.apache.spark.ml.feature.StopWordsRemover;

import org.apache.spark.SparkConf;
```

13

Textual data classification: example

```
public static void main(String[] args) {
    // Labeled and unlabeled instance types.
    // Spark SQL can infer schema from Java Beans.

    String inputFileTraining;
    String inputFileTest;
    String outputPath;

    inputFileTraining=args[0];
    inputFileTest=args[1];
    outputPath=args[2];

    // Create a configuration object and set the name of the application
    SparkConf conf=new SparkConf().setAppName("Text classification");

    // Create a Spark Context object
    JavaSparkContext sc = new JavaSparkContext(conf);
```

14

Textual data classification: example

```
// Create an SQLContext
SQLContext sqlContext = new org.apache.spark.sql.SQLContext(sc);

// Read training data from a textual file
// Each lines has the format: class-label,list of words
// E.g., 1,hadoop mapreduce
JavaRDD<String> trainingData=sc.textFile(inputFileTraining);

// Map each element (each line of the input file) to a LabeledDocument
JavaRDD<LabeledDocument> trainingRDD=trainingData.map(
    new InputData().cache());

DataFrame training = sqlContext.createDataFrame(trainingRDD,
    LabeledDocument.class);
```

15

Textual data classification: example

```
// Configure an ML pipeline, which consists of five stages:
// tokenizer -> split sentences in set of words
// remover -> remove stopwords
// hashingTF -> map set of words to a fixed-length feature vectors
//           (each word becomes a feature and the value of the feature
//           is the frequency of the word in the sentence)
// idf -> scales each features. Intuitively, it down-weights features
//           which appear frequently in the input lines
// lr -> logistic regression classification algorithm

//The tokenizer split each sentence in a set of words
Tokenizer tokenizer = new Tokenizer()
    .setInputCol("text")
    .setOutputCol("words");
```

16

Textual data classification: example

```
// Configure an ML pipeline, which consists of five stages:  
// tokenizer -> split sentences in set of words  
// remover -> remove stopwords  
// hashingTF -> map set of words to a fixed-length feature vectors  
//           (each word becomes a feature and the value of the feature  
//           is the frequency of the word in the sentence)  
// idf -> scales each features. Intuitively, it down-weights features  
//           which appear frequently in the input lines  
// lr -> logistic regression classification algorithm
```

// The tokenizer split each sentence in a set of words

```
Tokenizer tokenizer = new Tokenizer()  
.setInputCol("text")  
.setOutputCol("words");
```

A new attribute (containing a list of words) is
created based on the value of text

17

Textual data classification: example

```
// Remove stopwords  
StopWordsRemover remover = new StopWordsRemover()  
.setInputCol("words")  
.setOutputCol("filteredWords");  
  
// Map words to a features  
HashingTF hashingTF = new HashingTF()  
.setNumFeatures(1000)  
.setInputCol(remover.getOutputCol())  
.setOutputCol("rawFeatures");  
  
// Apply the IDF transformation  
IDF idf = new IDF().setInputCol("rawFeatures").setOutputCol("features");
```

18

Textual data classification: example

```
// Remove stopwords
StopWordsRemover remover = new StopWordsRemover()
.setInputCol("words")
.setOutputCol("filteredWords");

// Map words to a features
HashingTF hashingTF = new HashingTF()
.setNumFeatures(1000)
.setInputCol(remover.getOutputCol())
.setOutputCol("rawFeatures");

// Apply the IDF transformation
IDF idf = new IDF().setInputCol("rawFeatures").setOutputCol("features");
```

The TF-IDF value of each word is computed by combining two results of two methods

19

Textual data classification: example

```
// Create a classification model based on the logistic regression algorithm
LogisticRegression lr = new LogisticRegression()
.setMaxIter(10)
.setRegParam(0.01);

// Create the pipeline
Pipeline pipeline = new Pipeline()
.setStages(new PipelineStage[] {tokenizer, remover, hashingTF, idf, lr});

// Analyze the training data and create the classification model based
// on the specified pipeline
PipelineModel model = pipeline.fit(training);
```

20

Textual data classification: example

```
// Load the test/unlabeled data from a textual file  
JavaRDD<String> testData=sc.textFile(inputFileTest);  
  
// Map each element (each line of the input file) a LabeledDocument  
JavaRDD<LabeledDocument> testRDD=testData.map(  
    new InputData()).cache();  
  
DataFrame test = sqlContext.createDataFrame(testRDD,  
    LabeledDocument.class);  
  
// Make predictions on test documents.  
// The value of the label attribute is ignored during this step  
DataFrame predictions = model.transform(test);
```

21

Textual data classification: example

```
// Select only the text and  
// the predicted class for each record/document  
DataFrame predictionsDF=predictions.select("text", "prediction");  
  
// Save the result in an HDFS file  
JavaRDD<Row> predictionsRDD = predictionsDF.javaRDD();  
predictionsRDD.saveAsTextFile(outputPath);  
  
// Close the Spark Context object  
sc.close();  
}
```

22

Textual data classification: example

```
package it.polito.bigdata.spark.sparkmllib;  
  
import java.io.Serializable;  
  
public class LabeledDocument implements Serializable {  
    private double label;  
    private String text;  
  
    public LabeledDocument(String text, double label) {  
        this.text = text;  
        this.label = label;  
    }
```

23

Textual data classification: example

```
    public String getText() { return this.text; }  
    public void setText(String text) { this.text = text; }  
  
    public double getLabel() { return this.label; }  
    public void setLabel(double label) { this.label = label; }  
}  
};
```

24

Textual data classification: example

```
package it.polito.bigdata.spark.sparkmllib;
import org.apache.spark.api.java.function.Function;
@SuppressWarnings("serial")
public class InputData implements Function<String, LabeledDocument> {
    public LabeledDocument call(String record) {
        String[] fields = record.split(",");
        // Fields of o contains the id of the class label
        double classLabel = Double.parseDouble(fields[0]);
        String text = fields[1];
        // The content of the document is after the comma
        // Return a new LabeledDocument
        return new LabeledDocument(text, classLabel);
    }
}
```
