

DoubleRDDs and basic statistical measures

DoubleRDDs

- Spark provides specific actions for a specific numerical type of RDD called JavaDoubleRDD
- JavaDoubleRDD is an RDD of doubles
 - However, it is different from JavaRDD<Double>
 - Even if they contain the same type of objects
- On JavaDoubleRDDs, the following actions are also available
 - sum(), mean(), stdev(), variance(), max(), min(),..

2

DoubleRDDs

- A generic JavaRDD<T> containing elements of type T can be transformed in a JavaDoubleRDD by using two specific transformations
 - mapToDouble
 - flatMapToDouble
- mapToDouble and flatMapToDouble operate similarly to map and flatMap, but they return a JavaDoubleRDD

3

DoubleRDDs

- JavaDoubleRDDs can be created also by using the `JavaDoubleRDD.parallelizeDoubles(java.util.List<Double> list)` method of the `JavaSparkContext` class

4

MapToDouble transformation

MapToDouble transformation

- Goal
 - The mapToDouble transformation is used to create a new DoubleRDD by applying a function on each element of the "input" RDD
 - The new RDD contains one element **y** for each element **x** of the "input" RDD
 - The value of **y** is obtained by applying a user defined function **f** on **x**
 - $y=f(x)$
 - The data type of **y** is always double

6

MapToDouble transformation

- Method
 - The mapToDouble transformation is based on the `JavaDoubleRDD.mapToDouble(DoubleFunction<T>)` method of the `JavaRDD<T>` class
 - An object of a class implementing the `DoubleFunction<T>` interface is passed to the mapToDouble method
 - The `public double call(T element)` method of the `DoubleFunction<T>` interface must be implemented
 - It contains the code that is applied on each element of the "input" RDD to create the double values of the returned DoubleRDD
 - For each element of the "input" RDD one single double is returned by the call method

7

MapToDouble transformation: Example

- Create an RDD from a textual file containing the surnames of a list of users
 - Each line of the file contains one surname
- Create a new DoubleRDD containing the lengths of the input surnames

8

MapToDouble transformation: Example

```
//Read the content of the input textual file
JavaRDD<String> surnamesRDD = sc.textFile("surnames.txt");

// Compute the lengths of the surnames
JavaDoubleRDD lengthsDoubleRDD =
surnamesRDD.mapToDouble(surname ->(double)surname.length());
```

9

FlatMapToDouble transformation

FlatMapToDouble transformation

- Goal
 - The flatMapToDouble transformation is used to create a new RDD by applying a function `f` on each element of the "input" RDD
 - The new RDD contains a list of elements obtained by applying `f` on each element `x` of the "input" RDD
 - The function `f` applied on an element `x` of the "input" RDD returns a list of double values `[y]`
 - `[y]=f(x)`
 - `[y]` can be the empty list

11

FlatMapToDouble transformation

- The final result is the concatenation of the list of values obtained by applying `f` over all the elements of the "input" RDD
 - i.e., the final RDD contains the merge of the lists obtained by applying `f` over all the elements of the input RDD
- The data type of `y` is always double

12

FlatMapToDouble transformation

- Method
 - The flatMapToDouble transformation is based on the `JavaRDD<R>.flatMapToDouble(FlatMapFunction<T, R>)` method of the `JavaRDD<T>` class
 - An object of a class implementing the `FlatMapFunction<T, R>` interface is passed to the flatMap method
 - The `public Iterable<Double> call(T element)` method of the `DoubleFlatMapFunction<T>` interface must be implemented
 - It contains the code that is applied on each element of the "input" RDD and returns a list of Double elements included in the returned RDD
 - For each element of the "input" RDD a list of new elements is returned by the call method
 - The list can be empty

13

FlatMapToDouble transformation: Example 1

- Create an RDD from a textual file
 - Each line contains a sentence
- Create a new DoubleRDD containing the lengths of the words occurring in the input textual document

14

FlatMapToDouble transformation: Example 1

```
// Read the content of the input textual file
JavaRDD<String> sentencesRDD = sc.textFile("sentences.txt");

// Create a JavaDoubleRDD with the lengths of words occurring in
// sentencesRDD
JavaDoubleRDD wordLengthsDoubleRDD =
  sentencesRDD.flatMap(sentence ->
{
    String[] words=sentence.split("");
    // Compute the length of each word
    ArrayList<Double> lengths=new ArrayList<Double>();
    for (String word: words) {
        lengths.add(new Double(word.length()));
    }
    return lengths.iterator();
});
```

15

DoubleRDD actions

DoubleRDD actions

- The following actions are applicable only on JavaDoubleRDDs and return a Double value
 - `sum()`, `mean()`, `stdev()`, `variance()`, `max()`, `min()`
- All the examples reported in the following tables are applied on `inputRDD` that is a DoubleRDD containing the following elements (i.e., values)
 - `{1.5, 3.5, 2.0}`

17

DoubleRDD actions: Summary

Action	Purpose	Example	Result
<code>Double sum()</code>	Return the sum over the values of the inputRDD	<code>inputRDD.sum()</code>	7.0
<code>Double mean()</code>	Return the mean value	<code>inputRDD.mean()</code>	2.3333
<code>Double stdev()</code>	Return the standard deviation computed over the values of the inputRDD	<code>inputRDD.stdev()</code>	0.8498
<code>Double variance()</code>	Return the variance computed over the values of the inputRDD	<code>inputRDD.variance()</code>	0.7223
<code>Double max()</code>	Return the maximum value	<code>inputRDD.max()</code>	3.5
<code>Double min()</code>	Return the minimum value	<code>inputRDD.min()</code>	1.5

18

DoubleRDD actions: example

- Create a DoubleRDD containing the following values
 - {1.5, 3.5, 2.0}
- Print on the standard output the following statistics
 - sum, mean, standard deviation, variance, maximum value, and minimum value

19

DoubleRDD actions: example

```
// Create a local list of Doubles
List<Double> inputList = Arrays.asList(1.5,3.5,2.0);

// Build a DoubleRDD from the local list
JavaDoubleRDD distList = sc.parallelizeDoubles(inputList);

// Compute the statistics and print them on the standard output
System.out.println("sum:"+distList.sum());
System.out.println("mean:"+distList.mean());
System.out.println("stdev:"+distList.stdev());
System.out.println("variance:"+distList.variance());
System.out.println("max:"+distList.max());
System.out.println("min:"+distList.min());
```
