

# Introduction to databases

## Web applications in PHP to query a database - Practice n. 5

### Introduction

This practice has the objective of realizing a simple web application based on PHP to query a database.

### 1 Preliminary steps

This practice uses the Apache web server and the MySQL database available in XAMPP. In order to perform the practice it is necessary to start both the services.

#### 1.1 Starting of the MySQL server on the localhost and starting of Apache

The execution of the SQL scripts containing the SQL commands for creating and populating the database used in this practice is done through the web interface of MySQL. Before opening the MySQL web interface it is necessary to:

- Start the local Apache server;
- Start the local MySQL server.

In particular, perform the following steps:

1. Start the program "XAMPP Control Panel";
2. Start Apache by clicking on the "Start" button in the row relative to Apache;
3. Start MySQL by clicking on the "Start" button in the MySQL row;
4. Open the MySQL web interface (phpMyAdmin) by clicking on the "Admin" button in the MySQL row (the browser will automatically open on the URL associated to the administration and querying page of MySQL);
5. To run a SQL script from the MySQL web interface:
  - Select the "Import" panel;
  - Select the file containing the script you want to run and then click on "Go".

## 1.2 Publishing/loading a PHP page in XAMPP

The Apache web server in XAMPP, when active, uses as main folder the *htdocs* folder. This means that to request the file *index.php*, you must navigate to the address **http://localhost/index.php** and the file must be in the file system in the path **XAMPP/htdocs/index.php**. The folder *htdocs* is in the main folder of XAMPP. In Windows it is saved by default in the path *C:\XAMPP\htdocs*.

## 2 Creation and population of the database

The database used for this practice is the same that you created in the last practice. The database is called GYM and describes the activities of a gym. It is characterised by the following logical schema (primary keys are underlined):

```
1 TRAINER (SSN, Name, Surname, DateOfBirth, Email, PhoneNo*)
2 COURSE (CIId, Name, CType, CLevel)
3 SCHEDULE (SSN, WeekDay, StartTime, Duration, CIId, GymRoom)
```

Create the GYM database and populate it using the *createDB.sql* and *populateDB.sql* scripts that you find on the course website. After running the scripts, the database tables will contain the data reported in Tables 1, 2 and 3.

**Note:** to run multiple times the creation/population scripts remember to delete already existing instances of the database previously created from the Database panel or include the commands for deleting the preexisting tables at the beginning of the scripts.

SSN	Name	Surname	DateOfBirth	Email	PhoneNo
SMTPLA80N31B791Z	Paul	Smith	31/12/1980	p.smith@email.it	NULL
KHNJHN81E30C455Y	John	Johnson	30/5/1981	j.johnson@email.it	+2300110303444
AAAGGG83E30C445A	Peter	Johnson	30/5/1981	p.johnson@email.it	+2300110303444

Table 1: TRAINER table

CIId	Name	CType	CLevel
CT100	Spinning for beginners	Spinning	1
CT101	Fitdancing	Music	2
CT104	Advanced spinning	Spinning	4

Table 2: COURSE table

SSN	WeekDay	StartTime	Duration	CIId	GymRoom
SMTPLA80N31B791Z	Monday	10:00	45	CT100	R1
SMTPLA80N31B791Z	Tuesday	11:00	45	CT100	R1
SMTPLA80N31B791Z	Tuesday	15:00	45	CT100	R2
KHNJHN81E30C455Y	Monday	10:00	30	CT101	R2
KHNJHN81E30C455Y	Monday	11:30	30	CT104	R2
KHNJHN81E30C455Y	Wednesday	9:00	60	CT104	R1

Table 3: SCHEDULE table

## 3 Exercises

**Make sure to follow the preliminary steps: the database must be present and correctly populated, while the PHP file on which you work must be in the `htdocs` folder.**

Create a web application in PHP that allows both inserting a new course and inserting a new schedule for a course already existing. The steps to develop the app are listed in the following.

**Note:** the PHP method `mysqli_connect()` requires a username and a password as arguments. For simplicity, for the purposes of this practice, you can use the default ones:

- **username:** 'root'
- **password:** " (empty string)

### 3.1 Insertion of a new course

Create a form that requires all the necessary data to insert a new course in the database. The result page must evaluate the correct insertion of data from the user by verifying:

- if all fields have been filled;
- if the inserted course is not already present;
- if the data types are not coherent (for example an alphanumeric field has been inserted instead of a numeric one). **These checks must be done through appropriate functions.**

If the insertion ends correctly, a success message must be displayed, otherwise the error must be notified.

### 3.2 Addition of the CSS classes

To improve the user experience, the outcome of the course insertion must be properly styled. Use the CSS classes to create a green/red colored banner in the page returned by the server. In figures 1 and 2 you may see an example of application.

#### Inserimento riuscito

Il corso CT105 è stato inserito è stato inserito nel database.

**Figure 1:** An example of correct insertion.

#### Inserimento fallito

Non è stato possibile inserire il corso CT105 nel database.

**Figure 2:** An example of failed insertion.

### 3.3 Insertion of a new schedule

Create a form that allows the insertion of a new schedule for one of the existing courses. The form must allow to choose, through two dropdown menus, the SSN of the trainer in charge of the lesson and the code of the course of which you are inserting the schedule. The menus must display the trainers and the courses already present in the database.

The result page must evaluate the correct insertion of data from the user by verifying:

- if all fields have been filled;
- if there are inconsistencies among the values provided as start time and end time (for example, start time as 18:30 and end time as 15:00<sup>1</sup>);
- if the data types are not coherent (for example, the provided day is not one of the days of the week);
- if there are compatibility problems with the already present schedules. In particular, check if, in the provided day and time, the selected room is not busy and the selected trainer is not busy with another course.

**These checks must be done through appropriate functions.** If the insertion fails, the page must notify the error.

Giorno	Lunedì
Ora inizio:	18:00
Ora fine:	19:00
Sala:	3
Codice istruttore:	MTTSRG41L23G273B
Codice corso:	CT105

**Figure 3:** An example of the required form for the insertion of a new schedule.

---

<sup>1</sup>In PHP, dates and times can be checked (type checking) and compared (inconsistency checking) by using the function `strtotime($string)` that allows to convert a time provided as a string into a time format and so comparable. If the inserted string is NOT in a correct format, the function returns FALSE, otherwise the string is converted into time format.

## 4 Management of accented characters and encoding

The choice of the textual data encoding specifies in which format (that is with which and how many bytes) the characters are saved in the database. This choice is crucial to manage cases in which we have characters not present in the English alphabet, such as accents or other diacritics.

In this practice we will use the **utfmb4** encoding, that follows the 4-Byte UTF-8 Unicode Encoding standard. The file provided with the practice creates a database that uses this encoding:

creaDB.sql

```
...
CREATE DATABASE IF NOT EXISTS PALESTRA;
SET NAMES = 'utf8mb4';
...
```

At this point, to correctly query the database it necessary to specify, also in the PHP code, the encoding we want to use to communicate with the MySQL server. In the procedural version of APIs, the method **mysqli\_set\_charset()** is used. The method can be invoked:

process\_request.php

```
...
mysqli_set_charset($conn, 'utf8mb4');
...
```

Finally, since both the database and the PHP script work with UTF-8 encoding, **it is suggested that also the HTML source is in the same format**. It may happen that if we statically define values that contain, for example, accented characters, then these are wrongly encoded. It is then suggested to use a modern text editor (such as Visual Studio Code, Atom, Sublime Text, etc.) in which it is possible to easily specify the desired encoding.

# 5 Solutions

## 5.1 Creation of the database

```
1 -- create an empty database. Name of the database:  
2 SET storage_engine=InnoDB;  
3 SET FOREIGN_KEY_CHECKS=1;  
4 CREATE DATABASE IF NOT EXISTS palestra;  
5 SET NAMES 'utf8mb4';  
6  
7 -- use gym  
8 use gym;  
9  
10  
11 -- drop tables if they already exist  
12 DROP TABLE IF EXISTS SCHEDULE;  
13 DROP TABLE IF EXISTS COURSES;  
14 DROP TABLE IF EXISTS TRAINER;  
15  
16 -- create tables  
17  
18 CREATE TABLE TRAINER (  
19     SSN CHAR(20) ,  
20     Name CHAR(50) NOT NULL ,  
21     Surname CHAR(50) NOT NULL ,  
22     DateOfBirth DATE NOT NULL ,  
23     Email CHAR(50) NOT NULL ,  
24     PhoneNo CHAR(20) NULL ,  
25     PRIMARY KEY (SSN)  
26 );  
27  
28 CREATE TABLE COURSE (  
29     CIId CHAR(10) ,  
30     Name CHAR(50) NOT NULL ,  
31     Type CHAR(50) NOT NULL ,  
32     CLevel SMALLINT NOT NULL,  
33     PRIMARY KEY (CIId),  
34     CONSTRAINT chk_Level CHECK (CLevel>=1 and CLevel<=4)  
35 );  
36  
37 CREATE TABLE SCHEDULE (  
38     SSN CHAR(20) NOT NULL ,  
39     DayOfWeek CHAR(15) NOT NULL ,  
40     StartTime TIME NOT NULL ,  
41     Duration SMALLINT NOT NULL ,  
42     GymRoom CHAR(5) NOT NULL,  
43     CIId CHAR(10) NOT NULL,  
44     PRIMARY KEY (SSN,DayOfWeek,StartTime),  
45     FOREIGN KEY (SSN)  
46         REFERENCES TRAINER(SSN)  
47         ON DELETE CASCADE  
48         ON UPDATE CASCADE,  
49     FOREIGN KEY (CIId)  
50         REFERENCES COURSE(CIId)  
51         ON DELETE CASCADE  
52         ON UPDATE CASCADE  
53 );
```

## 5.2 Population of the database

```
1 SET storage_engine=InnoDB;
2 SET FOREIGN_KEY_CHECKS=1;
3 use gym;
4
5 -- Insert data
6 INSERT INTO TRAINER (SSN,Name,Surname,DateOfBirth,Email, PhoneNo)
7 VALUES ('SMTPLA80N31B791Z','Paul','Smith','1980-12-31','p.smith@email.it',NULL);
8 INSERT INTO TRAINER (SSN,Name,Surname,DateOfBirth,Email, PhoneNo)
9 VALUES ('KHNJHN81E30C455Y','John','Johnson','1981-05-30',
10        'j.johnson@email.it','+2300110303444');
11 INSERT INTO TRAINER (SSN,Name,Surname,DateOfBirth,Email, PhoneNo)
12 VALUES ('AAAGGG83E30C445A','Peter','Johnson','1981-05-30',
13        'p.johnson@email.it','+2300110303444');
14 INSERT INTO COURSE (CIId,Name,CType,CLevel)
15 VALUES ('CT100','Spinning for beginners','Spinning ',1);
16 INSERT INTO COURSE (CIId,Name,CType,CLevel)
17 VALUES ('CT101','Fitdancing','Music',2);
18 INSERT INTO COURSE (CIId,Name,CType,CLevel)
19 VALUES ('CT104','Advanced spinning','Spinning ',4);
20 INSERT INTO SCHEDULE (SSN,DayOfWeek,StartTime,Duration,CIId,GymRoom)
21 VALUES ('SMTPLA80N31B791Z','Monday','10:00',45,'CT100','R1');
22 INSERT INTO SCHEDULE (SSN,DayOfWeek,StartTime,Duration,CIId,GymRoom)
23 VALUES ('SMTPLA80N31B791Z','Tuesday','11:00',45,'CT100','R1');
24 INSERT INTO SCHEDULE (SSN,DayOfWeek,StartTime,Duration,CIId,GymRoom)
25 VALUES ('SMTPLA80N31B791Z','Tuesday','15:00',45,'CT100','R2');
26 INSERT INTO SCHEDULE (SSN,DayOfWeek,StartTime,Duration,CIId,GymRoom)
27 VALUES ('KHNJHN81E30C455Y','Monday','10:00',30,'CT101','R2');
28 INSERT INTO SCHEDULE (SSN,DayOfWeek,StartTime,Duration,CIId,GymRoom)
29 VALUES ('KHNJHN81E30C455Y','Monday','11:30',30,'CT104','R2');
30 INSERT INTO SCHEDULE (SSN,DayOfWeek,StartTime,Duration,CIId,GymRoom)
31 VALUES ('KHNJHN81E30C455Y','Wednesday','9:00',60,'CT104','R1');
```

## 5.3 Insertion of a new course

### 1. Front-end
